

Apple Ring

The future of fitness, right on your finger.

Health. Fitness. Freedom.

A ring designed around you.

Created by: Ella, Wendy, John, and Danny

Executive Summary

What?:

Sleek wellness ring that tracks health metrics through your finger

Who?:

Active, on-the-go college students

Why?:

Simple, stylish, and accurate fitness tracking, no bulky wearables

How?:

Syncs with your Apple ecosystem for seamless health insights

Research Highlights:

- 47.5% expect 5-day battery life or more
- 83.3% prioritize comfort and fit over and other physical feature of the ring

Health Wearable Market Shaping the Future of Wellness

Global fitness wearbale
market revenue

Drivers

Growing awareness related to
health and wellness

41.7% of total
revenue

Persona

“Living in a healthy and organized life is what I value the most”

Jessica Thompson

Age: 21

Gender: Female

University: U of R

Major: CS

Hometown: Seattle

Habits

- Fitness
- Active on social media
- Early adopter

Frustrations

- Get stressed
- Inconsistent sleeping + diet
- Busy schedule
- Charging multiple device

Goals

- Study & Life balance
- Simplicity
- Stay healthy
- Seek products that make life easier

Listening to Our Consumers: Insights that Inspire Innovation

Value Map

Value Proposition

The Apple Ring empowers college students to build healthier routines by giving them precise, real-time tracking, personalized habit insights, and a form factor that's so minimal and stylish they actually enjoy wearing it every day.

New Offer Positioning

Feature	Oura	Samsung Galaxy Ring	Ultrahuman Ring Air	RingConn	Apple Ring
Real-time tracking	✗ (delayed updates)	✓	✓	✓	
Sharp edges / discomfort	✗ (smooth)	✗	⚠ (some reports)	⚠	
Sweat & waterproof	✓	✓	! Not advised for sweat/water exposure	✗	
Data reliability	✓	✓	⚠ (inconsistent for some)	⚠	
Progress visualization	✗ (simple UI)	✓	✗	✗	
					★ Native real-time sync across iOS
					★ Zero-edge, micro-rounded interior
					★ Full sweat-proof + waterproof durability
					★ Apple-grade biometric calibration
					★ Integrated progress rings + iOS visual dashboard

Hypothesis 1

Battery Life Drives Daily Use

Why Critical:

Battery life directly impacts user satisfaction

To verify:

Ask users how long they expect the battery to last

Measure:

% of respondents who pick 4 days or more

Success criteria:

> 50% of users choose 4+ days

Test Result:

51% expect the battery to last 4 days or more

Insight Applied:

Should investigate battery expectations further

Hypothesis 2

Customization Preference

Why Critical:

Impacts cost and design decisions

To verify:

Rate customization on 5-point scale

Measure:

% of “very” or “extremely important”

Success criteria:

>50% rate it “very” or “extremely”

Test Result:

Only 44.8% rated it “very” or “extremely important”

Insight Applied:

Keep a unified Apple design

Hypothesis 3

Comfort and Fit Are Key Drivers

Why Critical:

Comfort determines long-term wearability

To verify:

Choose which ring features users value most

Measure:

% of respondents choosing “comfort and fit”

Success criteria:

>60% select “comfort and fit”

Test Result:

83.3% chose comfort and fit

Insight Applied:

Prioritize comfort design and soft materials

Key Risks

Potential challenges for Apple ring launch

Technical Risk

Challenge:

- Accuracy
- Limited internal space

Mitigation:

- Early prototype testing
- Apple Watch sensor teams

Cost Risk

Challenge:

- Precision design
- Complex materials

Mitigation:

- Unified exterior design
- Collaborate with suppliers

Privacy Risk

Challenge:

- Sensitive health data
- Unclear about how data is stored

Mitigation:

- New privacy architecture
- Apple's privacy track record

Success Factors

Marketing Strategy –
Targets active, tech-
savvy students

Battery & Accuracy –
Reliable 4–5 day
performance

User Engagement –
Personalized feedback
and motivation

Design & Comfort –
Sleek, lightweight, all-
day wear

Product Integration –
Syncs seamlessly with
Apple ecosystem

Thank You!

Any Questions?

Summary

A sleek, lightweight ring that tracks health and wellness for active college students.

Conclusion

Combines Apple's design and smart tracking to simplify daily wellness.

Future Outlook

Expanding into AI-driven insights and sustainable materials.

Appendix and Research Highlights

How long do you expect the battery of the ring to last per charge?

40 responses

If the ring had the features you value most, how much would you be willing to pay?

40 responses

How interested are you in the lightweight design of the ring?

40 responses

Please indicate your level of agreement with the following statement:

"I would prefer using one AI-powered app that integrates all smart ring data (health, fitness, and sleep) instead of using multiple separate apps."

39 responses

How important is it to you that the ring is waterproof (e.g., usable while swimming or showering)?

40 responses

What physical feature of the ring do you value the most?(Choose all that apply)

30 responses

When are you most likely to wear the ring? (Choose all that apply)

30 responses

How much do you care about being able to personalize the physical appearance of the ring?

29 responses

Which type of sleep tracking output do you find most useful?:

30 responses

Can you specify your level of agreement with the statement:

"Receiving achievement notifications or progress updates would motivate me to stay consistent with my fitness goals."

30 responses

Hypothesis 1

We believe that: a minimum 4 day battery life is an important purchase feature.

To verify that, we will: we will ask users to choose how long they expect the battery life to last.

And measure: the percentage of people that say they choose 4 days or more.

We are right if: more than 50% of users choose 4 days or more.

This hypothesis is critical because:

- Battery life directly impacts user satisfaction and willingness to wear the ring daily.
- Understanding the minimum acceptable battery life helps guide product design and pricing decisions.

Hypothesis 2

We believe that: users are willing to pay between \$250-\$300 on the ring.

To verify that, we will: let the users pick the maximum price they are willing to purchase.

And measure: the percentage of people who say they will purchase at the price of \$250-\$300.

We are right if: more than half of the users say that they will be willing to purchase if the price is between \$250-\$300.

This hypothesis is critical because:

- It identifies the optimal price range that balances affordability for students with profitability for the company.
- Understanding price sensitivity helps position the ring competitively against other wearable tech products.

Hypothesis 3

We believe that: users will be interested in the light-weighted/wearable feature of the Apple Ring.

To verify that, we will: ask them based on a likert scale, and explore how important it is from a scale of 1-5.

And measure: the ratings on the scale.

We are right if: the average score of users ratings are a 3.5 or higher.

This hypothesis is critical because:

- Comfort and wearability influence whether users keep the device on consistently, affecting long-term engagement.
- Understanding how much users value a lightweight design helps refine materials and product ergonomics.

Hypothesis 4

We believe that: college students value having all their fitness and health data integrated into one AI-powered app more than using separate apps for sleep, exercise, and wellness.

To verify that, we will: ask respondents if they would prefer a single AI app that integrates all data from their ring or multiple specialized apps for each function.

And measure: the percentage of respondents who choose the all-in-one AI app.

We are right if: more than 60% of respondents choose the all-in-one AI app.

This hypothesis is critical because:

- Integration determines how users will engage with the product ecosystem and whether they value convenience over app specialization.
- Knowing user preference for an all-in-one AI app guides development priorities and partnership decisions.

Hypothesis 5

We believe that: waterproof durability (resistance to sweat, handwashing, and swimming) is an important purchase factor for college students considering a fitness tracking ring.

To verify that, we will: ask respondents how important waterproof durability is when deciding whether to buy a fitness tracking ring (on a scale).

And measure: the percentage of respondents who rate waterproof durability as an important or very important purchase factor.

We are right if: more than 60% of respondents consider waterproof durability important or very important when deciding to purchase.

This hypothesis is critical because:

- Durability and water resistance are key factors influencing long-term usability and perceived product quality.
- Understanding how much users value waterproofing helps prioritize technical design features and justify production costs.

Hypotheses Brainstorm & Prioritization One

- Hypothesis:
- We believe that: a minimum 4 day battery life is an important purchase feature.
 - To verify that, we will: we will ask users to choose how long they expect the battery life to last.
 - And measure: the percentage of people that say they choose 4 days or more.
 - We are right if: more than 50% of users choose 4 days or more.

Test Result:

- Exactly 50% of people responded and said they would want 4 days or more of battery life

Insight Applied:

- Long battery life (4+ days) is important in driving purchase decision, but we still need more data to validate this hypothesis.

Survey N = 40

- Hypothesis:
- We believe that: users are willing to pay between \$250-\$300 on the ring.
 - To verify that, we will: let the users pick the maximum price they are willing to purchase.
 - And measure: the percentage of people who say they will purchase at the price of \$250-\$300.
 - We are right if: more than half of the users say that they will be willing to purchase if the price is between \$250-\$300.

Test Result:

- In combination, there are 12.5% responses indicating they are willing to pay \$250 or more

Insight Applied:

- Invalidated: People aren't willing to pay the target price (\$250-\$300) from our hypothesis so we need to re-evaluate our pricing for the ring.

Survey N = 40

- Hypothesis:
- We believe that: users will be interested in the light-weighted/wearable feature of the Apple Ring.
 - To verify that, we will: ask them based on a likert scale, and explore how important it is from a scale of 1-5.
 - And measure: the ratings on the scale.
 - We are right if: the average score of users ratings are a 3 or higher.

Test Result:

- Validated: More than 70% rate the light weight feature 4 or higher.

Insight Applied:

- The lightweight is important as part of the attributes for the ring

Survey N = 40

- Hypothesis:
- We believe that: college students value having all their fitness and health data integrated into one AI-powered app more than using separate apps for sleep, exercise, and wellness.
 - To verify that, we will: ask respondents if they would prefer a single AI app that integrates all data from their ring or multiple specialized apps for each function.
 - And measure: the percentage of respondents who choose the all-in-one AI app.
 - We are right if: more than 60% of respondents choose the all-in-one AI app.

Test Result:

- Our survey results show that most people highly agree with this statement and would rather have an all-in-one app, 76.9% of people either agreed or strongly agreed.

Insight Applied:

- We definitely need to make sure that we create an all-in-one app that integrates with the ring so that people can have all of their data in one area.

Survey N = 40

- Hypothesis:
- We believe that: waterproof durability (resistance to sweat, handwashing, and swimming) is an important purchase factor for college students considering a fitness tracking ring.
 - To verify that, we will: ask respondents how important waterproof durability is when deciding whether to buy a fitness tracking ring (on a scale).
 - And measure: the percentage of respondents who rate waterproof durability as an important or very important purchase factor.
 - We are right if: more than 60% of respondents consider waterproof durability important or very important when deciding to purchase.

Test Result:

- 82.5% of the responses said that water proof is very important or extremely important to them.

Insight Applied:

- Validated. Water proof is an important feature

Survey N = 40

Hypotheses Brainstorm & Prioritization Two

- Hypothesis:
- We believe that: the most important feature to users is comfort and fit
 - to test this we will make a choose all that apply portion on our survey
 - and measure the amount of people who pick comfort and fit
 - we are right if: more than 60% of users pick comfort and fit as an important feature for them

Test Result:

- 83.3% of people chose comfort and fit as one of their top driving factors

Insight Applied:

- we think that it is a very important factor and we will make sure that we use it

Survey N = 30

- Hypothesis:
- We believe that our target customers are most likely to wear this ring during sleep and workouts
 - To test this, we make them choose among different scenarios
 - And measure the percentages that choose sleep tracking and during work outs.
 - We are right if more than 50% of users pick these 2 scenarios

Test Result:

- 63% choose sleep tracking and 50% choose workouts

Insight Applied:

- Most users are interested in wearing the ring during sleep and workouts as they are attracted by the lightweight materials.

Survey N = 30

- Hypothesis:
- We believe that customers care about personalizing the appearance of their ring
 - To test this, we will ask customers to rate the customization feature on a likert scale
 - Customers value this feature if responses for "very" and "extremely" together are greater than 50%

Test Result:

- 44.8% of responses said they either care about this feature very much or extremely

Insight Applied:

- Majority of the response care about personalization, however, still failed the null hypothesis

Survey N = 30

Hypothesis:Users prefer personalized, actionable insights over raw data when it comes to sleep tracking.

-

Test Result: 50% of respondents prefer personalized insights while 50% still value raw data like duration and sleep stages.

-

Insight Applied:The Apple Ring should include both data views, quick summaries for general users and detailed reports for data-driven users. Offering dual modes

-

Survey N = 30

- Hypothesis:
- we believe that: users would rather have personalized, progress updates that motivate them to stay consistent with their fitness goals
 - to test this we will ask users their agreement level with this statement "receiving achievement notifications or progress updates would motivate me to stay consistent with my fitness goals"
 - and measure the amount of people who choose strongly agree and agree to the statement
 - we are right if: more than 40% of people choose that
- Test Result:
- 86.6% of people strongly agreed or agreed with the statement
- Insight Applied:
- we are correct in thinking that people want progress goals, they think that it would make them more consistent

Survey N = 30
