Entering the **public** **transportation** sphere

- 34 million users every weekday in the US
- Huge demand for cheap, efficient modes of transportation
- 15 million Americans face unreliable transit
- Ageing systems bring inefficiencies
- Unreliable, unsafe, and inefficient → room for growth!

Customers look for **easy**, **safe**, and **efficient** options to get them where they need to go

Jobs

- **Punctual** travel (F)
- Feeling **safe**, secure, and independent (E)
- Staying **connected** with friends & peers (S)

Pains

- **Unreliable** scheduling and long waiting times
- **Safety** concerns
- High cost for on-demand travel
- Unclear app/payment hassle

Gains

- Efficient transportation
- No parking required
- **Saving money**

College students use public transit to get to class and connect with friends

 Jennifer Lee

Introverted

Hard working

Ambitious

Community

Punctuality

Safety

Bio: Junior studying at UR. Lives off campus. Low income & unemployed. Often busy and pressed for time.

“ Getting to campus from my apartment is hard. If I miss the bus, there won’t be another one for 30 more minutes – I’ll definitely be late to class. ”

We provide **safe**, **efficient**, and **easy** rides

Your ride, on your terms

For college students and urban commuters looking for safer, more efficient transportation, our Tesla e-bike system provides on-demand, independent travel with enhanced safety features, no-hassle payment, and the freedom to leave your bike anywhere.

A safety-first e-bike system w/ an accompanying app

// Tap-to-pay

Find a bike, tap to pay, and go

// Safety features

- SOS/emergency contact notification button
- option to turn on automatic fall detection

// Integrated app

find nearby bike, w/ options for payment & customizations

Choose \$1 unlock fee + per mile rate, or subscription options

Positioning: Setting a new standard for rider safety and convenience

Keys to Differentiation

- Safety-first mobility
- Ease of use compared to competitors w/ tap-to-pay
- Lower cost: pay-per-mile (breaks industry standard)
- Flexibility: pick up & abandon anywhere
- Reliable Tesla engineering: built to last

Our business model leverages recurring revenues

Hypothesis 1: More users are likely to ride if there are options for tap-to-pay rather than only in-app payment

// Why critical?

- Key differentiator
- Many people reported the hassle of downloading an app & confusing UI discourages them from using bike/bus systems

// Test

Survey: Would you be more willing to use an e-bike if there is a tap-to-pay option available that does not require an app? (Rate 1 - 5)

// Results

Validated: 67% reported they would be more likely

// Actions

Implement tap-to-pay

Hypothesis 2: A safety feature for autonomous rebalancing increases users' willingness to try our service compared to other city bikes

// Why critical?

- Safety is a key consideration for people who use public transport
- Use the same hypothesis for each of our safety features to discern customer preference

// Results

Invalidated: 30% reported they would be more likely

// Test

Survey: Would you be more likely to use e-bikes if they have a safety feature for automatically stabilizing the bike, preventing falls?
(Rate 1 - 5)

// Pivots

Do not implement. Test for other safety features.

Hypothesis 3: users prefer a per-mile rate over a time-based rate when using e-bikes

// Why critical?

- Key differentiator (breaks market standard)
- Cost is a crucial factor when deciding which mode of transportation to use

// Test

Survey: Would you rather pay a rate per mile or a rate per minute when using an e-bike?

// Results

Validated: 79% preferred a per-mile rate

// Actions

Implement per-mile rate for pricing

Critical Risks/Mitigations

Users taking advantage of per-mile rate, keeping bike with them

> **Mitigation:** implement autolock after 15 mins idle & a button to end session

Low bike availability & poor distribution

> **Mitigation:** use predictive analytics and maintenance vans to redistribute

Failure and malfunctions of SOS and fall detection features

> **Mitigation:** Monthly safety audits and multiple sensors for fall detection

Next steps for success

What we need

- **Budget:** fund production of initial fleet of e-bikes, including bike manufacturing and maintenance costs
- **Marketing Support:** leverage Tesla's brand reputation & launch campaign focusing on safety → differentiate ourselves and build public trust
- **Launch** simple mobile app (MVP)
